Airport Security Screening Systems

The Jervis B. Webb Company is an industry leader in the design and installation of in-line EDS (Explosion Detection Systems) conveyor systems. Webb installed its first U.S. systems at Boston Logan International Airport and John Wayne Airport in 2002 and the list of security screening conveyor system installations continues to grow both in the United States and Canada. Webb currently has over 30 EDS lines completed with an additional 80+ scheduled to be commissioned through 2007.

Webb's experience includes systems mandated by both the United States Department of Homeland Security/Transportation Security Administration (TSA) and the

Canadian Air Transport Security Authority (CATSA). These systems include mechanical, electrical and communication interfaces to EDS equipment provided by the two primary in-line screening equipment suppliers, GE Security (formerly Invision Technologies) and L3 Communications.

A key component of any in-line EDS system is the ability to control the system operations while ensuring that only cleared bags are allowed to pass to the airline make-up area. Webb-View® is an integrated Baggage Handling Control System that successfully integrates the key functions of supervisory control, equipment control, manual encoding, and user interface into any baggage handling installation. Webb-View's ability to provide 100% bag tracking through the EDS evaluation matrix helps ensure that cleared bags are quickly released to the airline make-up areas while suspect bags are tracked through additional levels of security screening.

Reliability, accuracy, and high throughput are all characteristics of Webb's in-line EDS baggage handling systems. Webb's baggage handling products, installation, and service have met or surpassed industry standards for over a decade.

Jervis B. Webb Company provides state-of-the-art solutions to improve baggage throughput, accuracy and security to the airport industry.
